DETAILED ACTION

Election/Restrictions

1. Claims 9, 10, 11, 13, 28, 29, 30 and 32 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected invention, there being no allowable generic or linking claim. Applicant timely traversed the restriction (election) requirement in the reply filed on 08/24/2007.

2. Further restriction is required under 35 U.S.C. 121 and 372.

This application contains the following inventions or groups of inventions which are not so linked as to form a single general inventive concept under PCT Rule 13.1.

In accordance with 37 CFR 1.499, applicant is required, in reply to this action, to elect a single invention to which the claims must be restricted.

Group I, claim(s) 1, 3-7 and 9-18, drawn to a bonding method.

Group II, claim(s) 19, drawn to a product and

Group III, claims 20-39, drawn to an apparatus.

3. The inventions listed as Groups I, II and III do not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons:

The general inventive concept, a plasma treatment means for changing the ion strike force and the use of oxygen as a reaction gas is known from Nagakubu et al (US 5904860) in view of the admitted prior art.

Nagakubu et al. discloses an ionizing chamber that generates plasma of the desired frequency, changing the energy (ion strike force) from 200 eV to 10 eV (col. 4 lines 8-10, 34 and 62) and using a reactive gas in at least one of the physical and chemical treatment steps (col. 4 lines 1-5). It is noted that hydrogen and ammonia are only examples of reactive gases.

Nagakubu et al. does not disclose that oxygen is a possible reactive gas. However, applicant's admitted prior art teaches that it is known to use oxygen as the reactive gas when bonding certain substrates such as SiO₂. It is noted that Nagakubu et al. also discloses a bonding method for a member with an oxide surface. It would have been obvious to one of ordinary skill in the art at the time of invention to use oxygen as an alternative reaction gas because this reaction gas is known in the art.

Response to Arguments

As to the applicant's discussion of the teachings of USP 5904860, inert argon gas 21 is used in addition to reactive gases supplied by gas supply units 34 and 35. Applicant's assertion that inert argon gas 21 is a reaction gas is therefore incorrect.

The argument regarding the vacuum is not commensurate in scope with the claims because the independent claims do not mention the vacuum that is necessary to generate an ion beam.
